

# Wasp PackageTracker is now available on Android mobile devices!

Check out the cloud-based software that makes tracking packages from the mailroom to the recipient simple, fast, and accurate.

## FEATURES

### Easy-To-Implement

Be up and running in as little as one business day. Simply set up the different locations you deliver packages to and start tracking.

### Package Delivery & Receipt

Track packages from the time they arrive at your door, until they are delivered and signed for by the intended recipient.

### Attach Package Photos

Capture a photo of the package condition at each step of the delivery and record it in the software.

### Delivery Via Routes

Quickly know who has which package, where it is, when it was received in the building, estimated delivery, and other information.

### Electronic Signature Capture

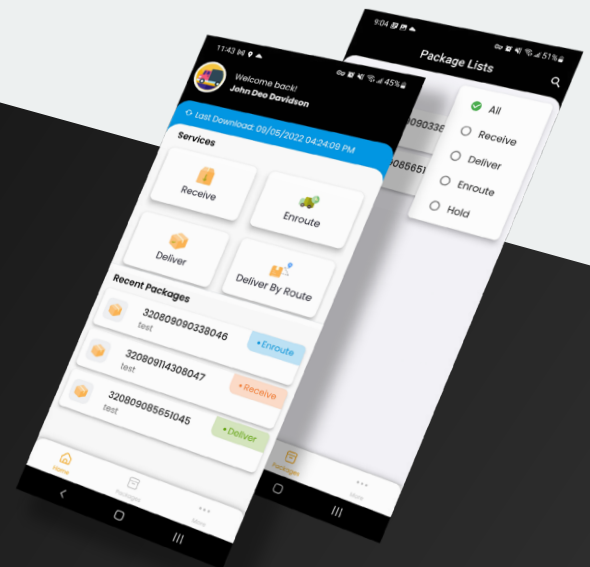

Since the receiving process is electronic instead of manual, human errors are virtually eliminated.

### View Recent Package History

Time spent searching for packages, communicating with recipients and re-ordering items for delivery are drastically cut.

### View Packages Enroute

With automated inbound package tracking, an item's delivery cycle (receipt, routing status, and final proof of delivery) is significantly streamlined.
